Dear CoreWeave hiring team,

CoreWeave's billing platform sits at the intersection of data correctness, audit-grade controls, and high-stakes product delivery, which is exactly the environment I've been operating in for the past several years. At Prometheus, I led the engineering and compliance work across a 7-year regulatory build-out that ended with the company becoming the first FINRA-approved Special Purpose Broker-Dealer in the US. That meant owning the integrity of backend systems where a data error didn't just produce a bad report, it carried direct regulatory risk. I coordinated change management and auditor communication across 3 concurrent audits, managed least-privilege access reviews, converted audit findings into prioritized remediation items in the SDLC workflow, and drafted the responses that kept auditors satisfied. The controls your Finance and Compliance partners will expect from a billing platform, written records of changes, clean access hygiene, audit-ready evidence, are controls I've built and defended under real scrutiny.

On the platform side, I designed the TypeScript microservice backend and PostgreSQL schemas that Prometheus's systems run on today, containerized services with Docker, and built the GitHub Actions CI/CD pipelines required to satisfy FINRA auditability requirements. The data-store design and pipeline reliability work your role describes maps closely to what I was accountable for: if the platform produced incorrect data, there was no fixing it quietly after the fact. I also took release management across 4 engineering teams from ad hoc deployments to a structured bi-weekly cadence, 3x faster than the prior process, which gave the business consistent, predictable delivery across a run of regulated milestones including custody launch, ETH custody, and clearing and settlement approval.

I grew Prometheus's engineering organization from just myself to a 20-plus person team spanning backend, frontend, QA, DevOps, and release management, with full hiring authority and ownership of every career-level and cultural decision. Driving roadmap execution across two billing sub-teams while balancing platform investments, new product launches, compliance obligations, and technical debt is a coordination problem I recognize. At Prometheus, that balance was the job, and shipping regulated milestones on time while keeping the platform audit-ready required exactly the kind of cross-functional partnering with product and stakeholders your role describes.

CoreWeave's billing pipeline is a metering and data-correctness problem at infrastructure scale, and while my background is in financial services rather than cloud infrastructure, the discipline the role requires, pipeline health, utilization integrity, audit-grade change management, SLA enforcement before errors reach customers, is discipline I've applied in a context where the consequences of getting it wrong were equally unforgiving. I'd welcome the conversation about whether that background translates to what you're building.
