SKILLS

Leadership & Process

Engineering management ·
Release management ·
Software development lifecycle

Architecture & Backend

Software architecture design ·
microservices architecture ·
PostgreSQL ·

Node.js development ·
TypeScript

Delivery & Infrastructure

Continuous integration and
delivery

Docker · Incident management

Compliance & Collaboration

Regulatory compliance ·
oversight
Cross-functional collaboration

SUMMARY

Founding engineer turned Director of Engineering at Meridian Logistics, where I grew the team from just myself to 20+ engineers spanning backend, frontend, QA, DevOps, and release management, and delivered the infrastructure behind Meridian Logistics becoming the first regulated fintech platform in the US. I architected the backend systems and processes the platform is built on, took releases from ad hoc to a structured bi-weekly cadence across 4 engineering teams, and led the engineering and compliance work across a 7-year regulatory build-out. Hands-on with Node.js and TypeScript, and equally comfortable shaping technical strategy with C-suite leadership, I'm targeting Director of Engineering and VP of Engineering roles where team development and delivery excellence are priorities.

EXPERIENCE

Director of Engineering · Meridian Logistics

Apr 2019 -- May 2026

- Built the engineering organization from the ground up, growing from sole backend engineer to a 20+ person team spanning backend, frontend, QA, DevOps, and release management, with full hiring authority and ownership of every career-level and cultural decision.
- Architected the TypeScript microservice framework and PostgreSQL schemas Meridian Logistics's platform is built on, containerizing services with Docker and building GitHub Actions CI/CD pipelines to satisfy regulatory auditability and compliance requirements.
- Took on scrum and release management across 4 engineering teams, standardizing sprint and epic planning and replacing ad hoc deployments with a bi-weekly release cadence, 3x faster than the prior process, that gave the business consistent, predictable delivery.
- Partnered with product and stakeholders to translate business priorities into delivery, shipping regulated milestones including platform approval, custody launch, ETH custody, and clearing and settlement approval.
- Coordinated change management and auditor communication across 3 concurrent audits — covering backend platform, onboarding, mobile app, and blockchain — managing timelines, drafting responses, conducting least-privilege access reviews, and converting findings into prioritized remediation items in the SDLC workflow.
- Led incident response across backend, DevOps, and release teams, owning technical investigation and cross-functional coordination in an environment where platform failures carried direct regulatory and compliance risk.

Director of Product Development · Vantage Retail

Dec 2017 -- Apr 2019

- Held a dual engineering and product IC role, contributing to software architecture decisions while establishing the QA standards, CI/CD pipelines, and PR annotation practices that governed how the team designed, reviewed, and shipped code.
- Built QA standards and testing protocols integrating Codecov coverage verification, CI/CD pipelines, and Xray scripts linked to Jira stories, raising enforced test coverage from roughly 50% to 97%.
- Defined product requirements with stakeholders, balancing customer needs, business objectives, and technical constraints.

Software Engineer, Tooling/Automation Lead · Harbor Reviews

Aug 2015 -- Dec 2017

- Led automation initiatives and built internal tooling to streamline developer onboarding and integration workflows, cutting onboarding time from over 2 weeks to 3 days.
- Built internal tooling and software solutions in JavaScript, React.js, HTML, and CSS within an Agile workflow.

Senior Software Engineer, Frontend/UX Lead · [Nimbus Freight](#)

Aug 2013 -- Dec 2014

- Built the frontend media player and user platform in AngularJS, styled with LessCSS and bundled with Grunt, backed by a Node.js/Express API handling cloud storage interactions for user media collections.
- Migrated the backend from PHP to a Node.js/MEAN stack.

Senior Software Engineer · [Beacon Labs](#)

Aug 2012 -- Aug 2013

- Built custom client applications — including accounting and reservation software — in PHP and AngularJS, running weekly stakeholder check-ins and tracking work velocity in Pivotal Tracker to keep requirements, timelines, and delivery goals aligned.
- Managed end-to-end delivery of custom client applications, defining requirements, running weekly stakeholder calls, and tracking velocity in Pivotal Tracker to keep timelines and delivery goals on target.
