Dear CoreWeave hiring team,

CoreWeave's billing platform sits at the intersection of metering correctness, audit-grade change management, and the product launch cadence that lets new consumption models reach customers cleanly. That combination maps directly to what I spent seven years building at Prometheus, where platform failures carried direct regulatory consequence and data correctness was not optional.

At Prometheus I designed the TypeScript microservice backend and PostgreSQL schemas the platform runs on today, built the GitHub Actions CI/CD pipelines to satisfy FINRA auditability requirements, and wrote the engineering standards and code review processes from scratch as the team scaled from one engineer to 20+. The compliance work was not a layer added afterward. It was baked into how code moved from a developer's branch to production, and into how we handled every audit finding. I coordinated change management and auditor communication across 3 concurrent audits, managed the least-privilege access review, and converted findings into prioritized remediation items entered into the SDLC workflow. An auditor pulling a sample of changes from that period would find a signed-off review, a test environment record, and a Jira ticket for every one of them.

On the delivery and team side, I took release management across 4 engineering teams from ad hoc to a structured bi-weekly cadence, partnering with product and stakeholders to translate business priorities into sprint and epic planning. I also embedded tech debt cleanup as a standing part of every sprint, not as a separate initiative but as a line item in the same workflow that handled new features and compliance work. That discipline kept a codebase that grew from 1 to 20+ engineers stable in an environment where shortcuts carried real regulatory risk. Balancing platform investment, new launches, compliance obligations, and debt retirement across multiple sub-teams is the exact tradeoff I made every planning cycle.

The billing-specific domain, metering pipelines, rating paths, SLA instrumentation for data completeness and freshness, is newer to me than the change management, audit coordination, and backend platform work. What I bring is a track record of owning the engineering rigor that makes financial and regulatory data trustworthy, and of building the team processes and standards that let that rigor hold as a platform scales.
